

EGR-DataServer

With the EGR-DataServer you distribute your product data in a completely new way - the data is available on an Internet server. The pCon application software has fully automatic access to this server and a dedicated process ensures that only designated data is made available.

By having a single central location for your data it is ensured that your whole sales organization has the right information available to them efficiently, securely and inexpensively.

Philosophy

Is it really necessary to spend a lot of time and effort to produce individual CD-ROMs for distribution? Must valuable time be spent manually installing data? The answer to this and other similar questions is NO as a practical alternative can now be found with the EGR-DataServer. The pCon applications can be directly connected to an internet server and automatically provided with all information required. The data is automatically synchronized between the two, so the users can fully concentrate on their work – not time-consuming technical tasks.

Up-to-date

Make your latest product data available to the client without any delay. Be sure that the user is always working with the most up-to-date data. Modify your data as often as it is necessary without any additional effort for your users. The EGR-DataServer offers an entirely new concept for what was, until now, a complex, time consuming and expensive service. It also has the additional benefit of giving you the comfort that everybody is working with the latest product and pricing information.

Target groups

With the EGR-DataServer you can make data available to many different target groups. The specialist dealer, your internal sales team as well as major customers can instantly be provided with the latest information that is relevant to them. Furthermore, the EGR-DataServer is not constrained by national borders or time zones. Irrespective of where it is needed the appropriate information is available from one central point 24 hours a day and 7 days a week.

Security

Special security procedures protect your data against any unauthorized access by third parties. The latest technology ensures full availability of information during the operating process and redundant systems ensure a high level of robustness. The EGR-DataServer transparently records the essential transactions in context with the online updating of the product data.

Technology

The EGR-DataServer is based on standard internet technology. It can be used in various environments, regardless of whether they be used over the internet, intranet or local networks. Even if users need to work offline from time to time, the EGR-DataServer reliably and efficiently provides your sales organization with the electronic product data they require.
